

Accessibility Testing Report – Dot.vu

Tested website: <https://www.dot.vu/>

Tested by: Claudia Pitu

Date: 10 April 2026

Environment: Google Chrome, Windows OS, WAVE Extension, Axe DevTools

Testing method: Manual keyboard testing and automated accessibility testing

Standard used: WCAG 2.1 AA

1. Introduction

This report presents the results of accessibility testing performed on the Dot.vu website. The website was evaluated using both automated tools and manual keyboard navigation to identify issues that may affect users who rely on assistive technologies or cannot use a mouse.

The manual test used only the Tab, Enter, and Escape keys. The automated test used WAVE and Axe DevTools to check structural, contrast, labelling, and name-related issues.

2. WAVE Testing (Static DOM)

BUG-001

Title	Missing page regions (landmarks)
Description	The page does not define clear structural regions such as main, header, or navigation.
Steps to Reproduce:	1. Open the website 2. Run WAVE 3. Check the alerts and page structure
Expected Result:	The page should use semantic landmarks such as main, header, and navigation.

Actual Result:	No page regions are defined.
Severity:	High
Priority:	High
Attachments	

BUG-002

Title	Poor semantic structure
Description	The page structure is not clearly defined using semantic HTML elements.
Steps to Reproduce:	1. Open the website 2. Run WAVE 3. Review the structure information
Expected Result:	The page should have a clear semantic structure.
Actual Result:	The structure is unclear.
Severity:	Medium
Priority:	Medium
Attachments	No attachments

3. Axe DevTools Testing (Dynamic DOM)

BUG-003

Title	Missing form labels
Description	Some form inputs are not properly associated with labels.
Steps to Reproduce:	1. Open the website 2. Open DevTools 3. Run Axe DevTools scan
Expected Result:	All inputs should have labels.
Actual Result:	Some labels are missing.
Severity:	Serious
Priority:	High
Attachments	

4. Manual Testing Findings

BUG-005

Title	Keyboard focus is not always visible
Description	While navigating the website with the Tab key, the focus indicator disappeared several times. In some cases, the page showed a small link preview in the

	bottom-left corner, but there was no clear visible focus on the actual page element.
Steps to Reproduce:	1. Open https://www.dot.vu/ 2. Press the Tab key to move through interactive elements 3. Observe the focus on the Dot.vu home button and the “14-Day Free Trial” button
Expected Result:	The keyboard focus should always remain clearly visible on the currently selected interactive element.
Actual Result:	The focus disappears on multiple steps, making it difficult to know which element is selected.
Severity:	High
Priority:	High
Attachments	No attachments

BUG-006

Title	Form fields are skipped during keyboard navigation
Description	When tabbing through the form section, the focus moved from the “Company/visit” field directly to “Terms and Conditions.” The fields “Company size” and “How can we help” were skipped.
Steps to Reproduce:	1. Open https://www.dot.vu/ 2. Navigate to the form using the Tab key 3. Move through the Name, Email, and Company/visit fields 4. Observe the next focused element
Expected Result:	All form fields should be reachable in a logical and predictable order using the keyboard.
Actual Result:	Some form fields are skipped during tab navigation.
Severity:	High

Priority:	High
Attachments	No attachments

BUG-007

Title	Popup cannot be closed with the keyboard
Description	A popup appeared during keyboard navigation, but pressing the Escape key did not close it.
Steps to Reproduce:	1.Open https://www.dot.vu/ 2.Do not use the mouse press the Tab key to navigate through the page 3. Navigate to an interactive element (e.g., button or link) 4.Press Enter to open a new page (e.g., "How it works" / interactive demo) 5.Continue using the Tab key until the popup appears 6. Press the Escape key
Expected Result:	The popup should close when Escape is pressed.
Actual Result:	The popup remains open and does not respond to the keyboard.
Severity:	High
Priority:	High
Attachments	No attachments

5. Automated Testing Findings

Automated testing with WAVE and Axe DevTools revealed additional accessibility issues. These included missing page regions, poor semantic structure, missing form labels, insufficient color contrast, empty links, empty buttons, and missing iframe titles.

The Axe DevTools scan also showed that the page uses a viewport setting that disables zooming, which can be a barrier for users who need to enlarge content.

6. Conclusion

The Dot.vu website has several accessibility issues that affect keyboard users and users of assistive technologies. The most important manual issues were disappearing focus, skipped form fields, and a popup that could not be dismissed with Escape.

The automated tools also found multiple issues related to labels, contrast, structure, and accessible names. Overall, the website would benefit from improvements in both keyboard accessibility and general WCAG compliance.
