

Selected Website

United Kingdom's **public service** broadcaster with strong **accessibility reputation**.

<https://www.bbc.com/>

Tolls Used

NVDA, Axe DevTools, Wave, Siteimprove

Evaluation included

- Keyboard Navigation - Manual
- Screen Reader - Basic Scan - NVDA
- Headings & Structure – WAVE / DevTools / Siteimprove
- Color Contrast - WAVE / Axe DevTools / Siteimprove
- Images & Media – Manual & NVDA
- Forms & Inputs – Manual & NVDA
- Dynamic Content - Manual & NVDA
- Zoom & Responsiveness – Manual 200 % + Manual Mobile
- Timing & Motion – Manual
- Links & Buttons – Manual

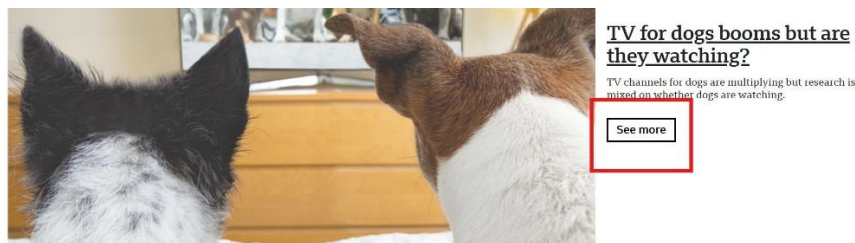

Notes

Keyboard Navigation is accurate, generally solid, given the complexity and amount of content of the website. Visible focus indicator always present. Logical tab order. No keyboard traps found. Screen Reader support is very good. Buttons and links have meaningful names. Nearly all inspected images have alt text and form fields are labelled. Headings & Structure with logical nesting. Color Contrast normal text, no issues found. Content readable and usable even when zoom in and in mobile. Buttons vs links used correctly with clear purpose.

Third-party ads, cookies consent pop ups etc. introduce accessibility violations that are not of the website perse. Often show in Wave, Siteimprove, automated test etc.

Bug Report Examples

SS-1								
Title	Repeated link "See More" - Homepage - Screen Reader							
Description								
Repeated link "See More". Non-descriptive link text.								
Steps to Reproduce								
1.Open https://www.bbc.com/ 2.Navigate through the homepage 3.“See More” links can be found mid and last part of the homepage								
Expected Result	“See More about [headline]”							
Actual Result	Multiple “See More” links with no context							
Severity	Critical		Major		Minor	x	Low	
Priority	High		Medium		Low			
Environment	Windows 11 – Chrome Browser v146 - NVDA Screen Reader							
Attachments	SS1.jpg							
Reported By	ADF							
Date	07/04/2026

Report Analysis & Conclusions

Playwright test results are extensive +1200 issues.

Is relevant to note that this is including issues out of the control of the developers of BBC website. For example, ads (3rd-party scripts), cookie consent banners (EU compliance), embedded media, and dynamically injected elements. Large amount of the issues was related to those 3rd party ads, cookie consent banners, like color, background, font-weight.

Automated tools like axe are good at detecting technical violations, missing alt text, color contrast issues, ARIA attribute misuse, form label problems. However, not good at Understanding context or intent, for example, an element is visible, content is meaningful, UX is actually usable etc.

Automated testing is not equal to complete accessibility testing. Manual testing catches what tools cannot. Therefore, manual testing remains essential. It allows testers to evaluate real user interactions, such as keyboard navigation, screen reader experience, meaning & usability (“See More” Bottom Link) and the real user experience.

A combined approach, using both automated and manual testing, provides the most accurate and comprehensive assessment of accessibility.
